WO 2005/016882 A1

TITLE OF THE INVENTION

[0001] MONOMERS, OLIGOMERS AND POLYMERS OF 2-FUNCTIONALIZED AND 2,7-DIFUNCTIONALIZED CARBAZOLES.

FIELD OF THE INVENTION

5 **[0002]** The present invention relates to a new class of organic material. More specifically, the present invention is relates to monomers, oligomers and polymers of 2 functionalized and 2,7-difunctionalized carbazoles.

BACKGROUND OF THE INVENTION

10 **[0003]** Conjugated polymeric and oligomeric organic materials are subject to important investigations from both academic and industrial laboratories, due to their great potential for applications in light-emitting diodes, field-effect transistors, sensors, solar cells, etc.¹⁻⁷

15 **[0004]** The relatively low cost synthesis, ease of processability and the great tunability of their optical and electrical properties through chemical modification are just some of the advantages provided by organic semi-conducting materials over their inorganic counter parts.

20 **[0005]** Important developments in modern synthetic chemistry, especially the chemistry of carbon-carbon bond formation (Kumada, Stille, Yamamoto, Suzuki, Heck, and Sonogashira couplings, etc.) have allowed the synthesis of well-defined conjugated oligomers and polymers having a high degree of purity and improved physical properties in comparison to those obtained by traditional oxidative couplings. Moreover, a good understanding of the structure-property relationship, combined with the many new, highly selective synthetic methods now available, have allowed for the development of a nearly unlimited number of

structures having specific properties and performances approaching those of their inorganic counterparts. Small molecules having planar structures generally lead to highly ordered solid π - π^* interactions. Therefore, 2,7-carbazolenevinylene-based materials can thus be used in electronic devices requiring good charge transport properties, such as in field-effect transistors. Depending on the sought-after applications, different building blocks, such as thiophene, pyrrole, phenylene, fluorene and carbazole can be used, irrespective of their specific properties. In this regard, 2,7-carbazole-based well-defined polymers have been recently prepared.^{8,9} Their good fluorescence properties have led to the preparation and testing in light-emitting diodes of electroluminescent polymers spanning the entire visible range.^{10,11,12} The introduction of a vinylene unit into the polymer backbone is known to decrease the band gap due to the relatively low dihedral angle between the vinylene unit and a common aryl group. Consequently, medium to low band gap materials can be obtained, allowing for the preparation of a wide variety of luminescent polymers providing for green to red-light emissions.

[0006] However, the development of new building blocks for the preparation of 2,7-carbazolenevinylene-based materials remains a challenge to any chemist or physicist desirous of optimizing material performance in electronic devices requiring good charge transport properties.

20 [0007] The present invention seeks to meet these needs and other needs.

[0008] The present description refers to a number of documents, the content of which is herein incorporated by reference in their entirety.

Experimental

[0058] **Characterization:** Number-average (M_n) and weight-average (M_w) molecular weights were determined by size exclusion chromatography (SEC) using an HPLC pump and a Waters UV-vis detector. A calibration curve was prepared using a series of monodispersed polystyrene standards in THF (HPLC grade, Aldrich). UV-vis absorption spectra were recorded on a Hewlett-Packard diode-array spectrophotometer (model 8452A) using quartz cells (1-cm path length). Optical band gaps were calculated from the onset of the UV-visible absorption band. For solid-state measurements, polymer solutions in chloroform were cast on quartz plates. Fluorescence spectra were measured using a Varian Eclipse spectrofluorimeter. For fluorescence analyses in solution, the polymer concentration was about 10^{-6} M. The fluorescence quantum yield (ϕ_F) for PCVBN was determined in argon-saturated chloroform solutions at 298 °K using 9,10-diphenylanthracene (Aldrich) in cyclohexane as the standard ($\phi_F = 0.90$). The fluorescence quantum yield for PCV, PCVP and PCVDPATA was determined against PQC10 ($\phi_F = 0.11$) in chloroform¹³, while 1,3,5,7,8-pentamethyl-2,6-diethylpyrromethane•BF₂ ($\phi_F = 0.83$) in ethanol¹⁴ was used for PCCVP and PCVDPAP. For solid-state fluorescence analyses, polymer solutions were cast on

a triangular quartz cell and placed at 45° with respect to the incident beam. All fluorescence excitation spectra were found to be equivalent to their respective absorption spectra.

5 **[0059] Materials:** Chloroform (spectrograde) was purchased from Aldrich and used as received. 2,5-bis(diphenylamino)terephthalaldehyde, [4-(2-ethylhexyloxy)-phenyl]-bis-(4'-formylphenyl)amine, 2,5-dioctyloxy-1,4-diformylbenzene, 6,6'-dibromo-2,2'-bis(2"-ethylhexyloxy)-1,1'-binaphthyl and 3-hexyl-2,5-bis(methylphosphonate)thiophene were synthesized as previously described in literature.^{15,16,17,18,19}

INTERNATIONAL SEARCH REPORT

International application No.
PCT/CA2004/001509

Box No. II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons :

1. ☐ Claims Nos. :
because they relate to subject matter not required to be searched by this Authority; namely:

2. ☒ Claims Nos.: 44 (in part) and 100 (in part)
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically :

due to the lack of support and the broadness of claims 44 and 100, the search of claims 44 and 100 was limited to polymerization products of 2-functionalized and 2,7-difunctionalized carbazole derivatives and to the examples given in figures 1 to 4.

3. ☐ Claims Nos. :
because they are dependant claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box III Observation where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows :

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos. :

4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos. :

Remark on Protest ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.
